WART PEEL MEDICATION

Description of this medication:
This medication contains Salicylic Acid and 5-fluorouracil in a compounded liquid base that is used to treat warts.

How to use this medication:
1. Apply medication at bedtime. You may file down dead skin over the wart prior to application of the medication.
2. Apply a very small amount of medication to the wart. Using the dropper, apply a thin layer directly onto the wart. Use care to avoid applying the medicine to healthy skin. The medicine will break down healthy skin as well as the warts.
3. You can apply a Band-Aid or duct tape over the areas after the medication has dried.
4. Put the cap back tightly on the bottle.
5. Wash hands after applying the medicine. NEVER put the product in the mouth, nose, or eyes.
6. Remove the Band-Aid or duct tape in the morning and wash the area thoroughly.
7. There may be stinging upon application that lasts for a few minutes. Fanning the area can help alleviate this. If irritation and pain become excessive, you may take a break for a few days and then restart.

What to Expect:
During the first few days of application the skin around the wart may swell and become white or red. This will slough off with continued applications.

Normal Dosage:
The medication is applied once daily for 1-2 months, determined by your skin care provider.

Storage Dosage:
Store this medication at room temperature. Keep out of reach of children. Protect from light.

Side effects:
Rash and irritation, especially if medication is applied to normal skin.

Cautions and Warnings:
Only apply the medication to the warts. Do not apply to normal skin. Do not use on nose, eyes, or mouth. Prior to using this medication; it is important to inform your skin care provider if you are pregnant or thinking of becoming pregnant. Do not use if pregnant or nursing.
